

## Proof

Part 4

## Theorems

The Big Bang Theory

## Theorems

- A *theorem* is a statement we intend to prove using existing known facts (called *axioms* or *lemmas*)
- Used extensively in all mathematical proofs – which should be obvious

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

3

## Example

- Most theorems are of the form: If X, then Y
- The theorem below is very easy to interpret

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

4

## Example

- Theorems are arguments
- They can be structured as such.

```
x is even
y is even
-----
x * y is even
```

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

5

## Example

- Sometimes it is hard to see
- Below, the same theorem is written using different language

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

6

## Some Basic Definitions

Abstract? Not really.

## Definition: $x$ is even

- $x$  is even if and only if...
- $x = 2n$  for some integer  $n$

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 8

## Definition: $x$ is odd

- $x$  is odd if and only if...
- $x = 2n + 1$  for some integer  $n$

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 9

## Definition: $x \mid y$ ( $x$ divides $y$ )

- $x \mid y$  ( $x$  divides  $y$ ) iff...
- $y = x * k$  for some integer  $k$

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 10

## Definition: $x \in \mathbb{Q}$ ( $x$ is a rational)

- $x$  is a rational number iff...
- $x = y / z$  for some integers  $y$  and  $z$ , and  $z \neq 0$

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 11

## Proving $A \rightarrow B$

Modus Ponens

## Proving $A \rightarrow B$

- The boolean operator  $A \rightarrow B$  is true except when  $A$  is true and  $B$  is false
- So, we prove  $A \rightarrow B$  by showing that *whenever  $A$  is true, so must  $B$*

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

13

## Proving $A \rightarrow B$

- This is essentially a *Modus Ponens* proof
- You are showing that if **A** is true, and  $A \rightarrow B$  is true, then **B** must be true
- Also note that "A" and "B" can be compound statements

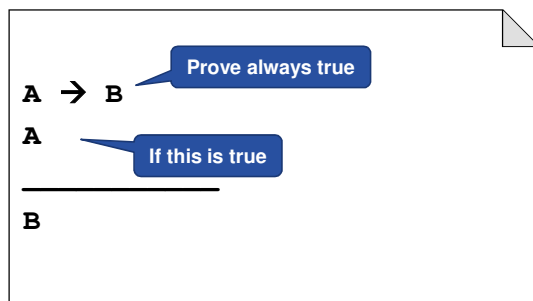

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

14

## Modus Ponens

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

15

## The Steps

- There are basically just two steps to follow:
  1. Assume A is true
  2. Argue that B is true
- This shows that B is true whenever A is true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

16

## Example

- Let's prove the following theorem from before
- This is actually quite easy

If  $x$  and  $y$  are even integers  
then  $x * y$  is an even integer

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2016

17

## Example – the argument

```
x is even
y is even
-----
x * y is even
```

3/15/2018

Sacramento State - Cook - CSci 28 - Spring 2019

18

## Example – internal structure

- Remember: all proofs are implications
- So, we will assume the both premises are true and show conclusion must be true.

$x \text{ is even} \wedge y \text{ is even} \rightarrow x * y \text{ is even}$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

19

## Example

Assume that  $x$  and  $y$  are **even** integers.

So, by the definition...

$x = 2i$  and  $y = 2j$  (for some  $i, j$ )

Note: use different arbitrary variables or you are assuming they are equal!

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

20

## Example

So, the product is:

$$\begin{aligned} x * y &= 2i * 2j \\ &= 4 * i * j \\ &= 2 * (2 * i * j) \end{aligned}$$

So, by definition,  $x * y$  is even

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

21

## Proof Tips

- Begin your proof with what you assume to be true (the hypothesis)
- Don't** argue the truth of a theorem *by example*
  - stay abstract
  - e.g. you know  $x$  and  $y$  are even integers – that's all you know

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

22

## Proof Tips

- Your proof must work forward from your assumptions to your goal
- You may work backward on scratch paper to help you figure out how to work forward

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

23

## Proof Tips

- Write your proof in prose
- Then read out loud, it should sound like well-written paragraph
- Quite often you'll use definitions to make progress

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

24

## Example

- The following is a theorem about the product of an odd and even number
- The proof is straight-forward using the definitions

<input type="radio"/>	
<input type="radio"/>	If $x$ is even and $y$ is odd, then $x * y$ is even
<input type="radio"/>	

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

25

## Example

**Assume:**

**$x$  is an even integer and  
 $y$  is an odd integer.**

**Then  $x = 2i$  and  $y = 2j+1$  for some integers  $i$  and  $j$**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

26

## Example

**Multiplying, we get:**

$$\begin{aligned}x * y &= (2i) * (2j + 1) \\&= 4ij + 2i \\&= 2 * (2ij + i)\end{aligned}$$

**...which is even**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

27

## Example: Let's Try...

- The following is a theorem about the sum of two odd numbers
- *Let's try this one...*

<input type="radio"/>	
<input type="radio"/>	If $x$ is odd and $y$ is odd, then $x + y$ is even
<input type="radio"/>	

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

28

## Example: Let's Try...

- How about something more complicated?
- The following is a theorem about the product of two odd numbers
- *Let's try...*

<input type="radio"/>	
<input type="radio"/>	If $x$ is odd and $y$ is odd, then $x * y$ is odd
<input type="radio"/>	

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

29

## Proof by Contrapositive

Proof with inverse logic

## Proof by Contrapositive

- There are several techniques that can be employed to prove a theorem
- The direct approach, like before is quite common, but its not the only path you can take

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

31

## Proof by Contrapositive

- Proof by Contrapositive* has you prove the opposite of the original theorem
- Quite impressively, this will also prove the original theorem

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

32

## Getting the Contrapositive

- First
  - negate both the assertion and conclusion of the implication
  - so, basically, put "not" in front of both operands
- Second...
  - reverse the implication
  - you basically swap the left-hand and right-hand operand of the implication

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

33

## Getting the Contrapositive

- So, both operands swap positions and are negated
- Are they equal? Let's confirm in a Truth Table

$p \rightarrow q$  composite is:  $\neg q \rightarrow \neg p$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

34

## Contrapositive Truth Table

p	q	$\neg q$	$\neg p$	$p \rightarrow q$	$\neg q \rightarrow \neg p$
T	T	F	F	T	T
T	F	T	F	F	F
F	T	F	T	T	T
F	F	T	T	T	T

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

35

## Modus Ponens Contrapositive

$\neg B \rightarrow \neg A$

Prove always true

$\neg B$

If this is true

$\neg A$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

36

## How it Works

- So, if we prove the contrapositive, we also prove the original theorem
- For the original  $A \rightarrow B$ 
  - suppose that if  $B$  is false
  - show that  $A$  must be false
- It does make sense, if you think about it

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

37

## Example

- The following is a theorem should look familiar
- This theorem states that the square of an odd number is also odd
- *Direct proof is near impossible!*

○  
○ If  $x^2$  is odd then  $x$  is odd  
○

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

38

## Example Contrapositive

- The contrapositive negates each operand in the implication  $A \rightarrow B$
- The following shows the reverse of each

○  
○  $A = x^2$  is odd  
○  $\neg A = x^2$  is not odd =  $x^2$  is even  
○

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

39

## Example Contrapositive

- The contrapositive negates each operand in the implication  $A \rightarrow B$
- The following shows the reverse of each

○  
○  $B = x$  is odd  
○  $\neg B = x$  is not odd =  $x$  is even  
○

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

40

## Example Contrapositive

- Finally, we reconstruct our theory with  $B \rightarrow A$  rather than  $A \rightarrow B$
- This expression is equivalent to the original

○  
○ if  $x$  is not odd then  $x^2$  is not odd  
○  
○ or... if  $x$  is even then  $x^2$  is even  
○

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

41

## Example Contrapositive

We assume  $x$  is not odd

$x$  is not odd means  $x$  is even

$x = 2k$  for some integer  $k$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

42

## Example Contrapositive

We assume  $x$  is not odd (even)

$$\begin{aligned}x^2 &= (2k)^2 \\&= 4k^2 \\&= 2(2k^2)\end{aligned}$$

So,  $x^2$  is even which is *not odd*

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

43

## Example Result

We proved:

if  $x$  is even then  $x^2$  is even

By contrapositive, we proved:

if  $x^2$  is odd then  $x$  is odd

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

44

## Proof by Contradiction

Welcome down the rabbit hole

## Proof by Contradiction

- *Proof by Contradiction* takes a novel approach
- It uses the approach of *reductio ad absurdum*
- So what is it? Well, it proves the theorem by showing it can't be false

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

46

## But, How?

- Assume it is *false*
- Show that (if it is false) something impossible results
- Therefore, it can't be false and, thus, true!

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

47

## Contradicting Implications

- So, if you are proving  $A \rightarrow B$
- Assume  $A \wedge \neg B$  ...which is equivalent to  $\neg(A \rightarrow B)$
- Show that something *impossible* results – therefore,  $A \rightarrow B$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

48

## Contradiction

A	B	$\neg B$	$A \wedge \neg B$	$\neg (A \rightarrow B)$
T	T	F	F	F
T	F	T	T	T
F	T	F	F	F
F	F	T	F	F

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

49

## Example

- The following is a classic Proof By Contradiction
- The theorem covers if the square-root of 2, is an irrational number

☐

☐ The square root of 2 is irrational

☐

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

50

## Example

- To prove by contradiction, we need to show that the opposite cannot be true (i.e. false)
- The sentence bellow is the theorem negated
- So, how do we go about proving this?

☐

☐ The square root of 2 *is rational*

☐

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

51

## Example

- Well, what is a rational number?
- A rational number can be expressed as "a / b" where a and b are *integers with no common factors* (aka "lowest terms")

☐

☐ The square root of 2 *is rational*

☐

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

52

## Examples of Rational Numbers

- 1 / 3
- 7 / 1
- 22 / 7
- 7734 / 10001
- 1 / 123456789
- 5 / 3

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

53

## The Proof: Prove Opposite

$\sqrt{2}$  is rational

$\sqrt{2} = a / b$  where  $a, b \in \mathbb{Z}$   
and  $b \neq 0$   
and  $a, b$  have no common factors

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

54

## Analyzing a

$$\sqrt{2} = a / b$$

$$\sqrt{2} * b = a$$

$$2 * b^2 = a^2$$

Let's look at the properties of a

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

55

## Analyzing a – It is even

$$2 * b^2 = a^2$$

So...  $a^2$  is an even number

therefore we know  $a$  is also even  
(previous proof - even \* even)

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

56

## Analyzing b

Since  $a$  is even and  $a / b$  is in lowest terms, then  $b$  must be odd

Why? If  $b$  is even, then  $a / b$  would have common factors - namely 2.

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

57

## Example: Oh ohhhhh

However... look again at  $2 * b^2 = a^2$

Since  $a$  is even,  $a^2$  is a multiple of  $2^2$  (aka, a multiple of 4)

So,  $2 * b^2$  is also a multiple of 4

Thus,  $b$  is even

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

58

## Result

Since  $b$  has to be both odd and even, we have a contradiction

The theorem "square root of 2 is rational" cannot be true

Therefore, "square root of 2 is irrational" is true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

59

Predicate  
Logic

Just the facts...

## Predicate Logic

- A predicate is a statement about one or more variables
- It is stated as a fact – being true for the data provided

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

61

## Predicate Logic

- Predicates express *properties*
- These can apply to a single entity or *relations* which may hold on more than one individual

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

62

## Predicate Notation

- It follows the same basic syntax as function calls in Java (and most programming languages)
- However, type case **is** important:
  - constants start with lower case letters
  - predicates start with upper case letters

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

63

## Single variable predicate

- Predicates can have one variable (at a minimum)
- The following sentence states one that the cat named Pattycakes has the "sleepy" property

**"Pattycakes The Cat is sleepy"**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

64

## Single variable predicate

- Alternatively, we can write it in predicate form
- The "Sleepy" predicate for "Pattycakes" is true
- Note the uppercase and lowercase!

**Sleepy (pattycakes)**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

65

## Two Variable Predicate

- Predicates can have multiple variables (unlimited actually... well within reason)
- The following is a classic example of a two-variable relationship

**$x < y$**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

66

## Two Variable Predicate

- The LessThan predicate is true for x, y

**LessThan(x, y)**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

67

## Predicates Summary

- 1-place predicates assign properties to individuals:
  - \_\_\_ is a cat
  - \_\_\_ is sleepy
- 2-place assign relations to a pair
  - \_\_\_ is sleeping on \_\_\_
  - \_\_\_ is the capitol of \_\_\_

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

68

## Predicates Summary

- 3-place predicates assign relations to triples
  - \_\_\_ wants \_\_\_ to \_\_\_
  - Cat named \_\_\_ likes to \_\_\_ on \_\_\_
- Etc...

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

69

## Quantified Statements

More Symbols

## Quantified Statements

- Sometimes we want to say that *every element in the universe* has some property
- Let's say the universe is the people in this room and we want to say "*everyone in the room is awake*"

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

71

## Limitations of Propositional Logic

- While propositional logic can express a great deal of complex logical expressions, it ultimately is insufficient for all arguments
- Why? The premises (and conclusions) in propositional logic have no internal structure.

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

72

## Propositional Approach #1

- We can write out a descriptive sentence
- Shortcomings:
  - it is monolithic and inflexible
  - not "mathematical" enough

**Everyone in this room is awake.**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

73

## Propositional Approach #2

- We can also write out that sentence using a long list of predicates
- So, we list them all or make a pattern
- Shortcomings: Cumbersome & verbose

**P(moe) and P(larry) and P(curly) and ...**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

74

## Limitations of Propositional Logic

- For example, it cannot show the validity of Socrates Argument
- This arguments states:  
*"All humans are mortal.  
 Socrates is a human.  
 Therefore, he is mortal."*

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

75

## Socrates Argument

- The following is the propositional logic form of the Socrates Argument
- Can we prove the conclusion?

**All humans are mortal  
 Socrates is a human  
 —————  
 Therefore, Socrates is mortal**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

76

## The Socrates Argument

- The following is the argument in normal form
- A problem arises since the validity of this argument comes from the internal structure which propositional logic cannot "see"

**H  
 S  
 ———  
 M**

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

77

## Solution

- It's time to break apart the logic and see the internal structure
- So, we are splitting the atom!

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

78

## Why go nuclear?

1. Expose the internal structure of those "atomic" sentences
2. Create new terminology to describe the semantics
3. Introduce laws to use and manage them

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

79

## New Notation: For All

- The "For-All" symbol states every element  $x$  in the universe makes  $P(x)$  true
- So, it is true if and only if the every  $P$  is the universe is true

$$\forall x P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

80

## New Notation: Exists

- The "Exists" States at least one element  $x$  in the universe makes  $P(x)$  true
- True if just a single  $P$  is true

$$\exists x P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

81

## Example: Pineapple Pizza

- Let's create the quantified statement for *"Someone doesn't like pineapple pizza!"*
- Let's create a predicate  $P(x)$  means *"x likes pineapple pizza"*
- What does someone mean? At least one person?

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

82

## Pineapple Pizza: Try #1

- How about the following expression?
- It's **not true** if at least **one** person likes pineapple
- This means *"nobody likes pineapple pizza"*

$$\neg (\exists x P(x))$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

83

## Pineapple Pizza: Try #2

- We can also negate the predicate
- Means, for at least one person, they dislike pineapple pizza
- Which is: *"someone doesn't like pineapple pizza!"*

$$\exists x \neg P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

84

## Quantifier Equivalence

Quantifier Conversion

## Equivalence

- Just like propositional logic, quantitative expressions have equivalencies
- They follow the same basic logic we have seen before

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 86

## Example: Opposite Expression

- Example: "Everyone in the room is awake"
- Let's create the opposite of this expression (*that still says the same thing*)

☐   
☐ "Everyone in the room is awake."   
☐

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 87

## Example: Opposite Expression

- So, let's just negate the predicate "is awake" into "is asleep"
- Does that work? **No.**

☐   
☐ "Everyone in the room is **asleep**."   
☐

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 88

## Example: Opposite Expression

- Now, let's negate the quantifier "everyone" (for-all) into "someone" (exists)
- The expression below works: **almost**

☐   
☐ "Someone in the room is asleep."   
☐

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 89

## Example: Opposite Expression

- Well, what if we negate the quantifier "everyone" (for-all) into "someone" (exists)
- The expression below works: **yes**

☐   
☐ "There is **no one** in the room that is asleep."   
☐

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 90

## Exists and For-All

- The previous two laws allows us to extrapolate two additional laws
- Note: we simply push the negative and remove the double-negation

$$\forall x P(x) \equiv \neg \exists x \neg P(x)$$

$$\exists x P(x) \equiv \neg \forall x \neg P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

91

## Equivalence – Moving Negation

- You can push a negation through a quantifier by toggling the quantifier
- Read the expressions below carefully

$$\neg \exists x P(x) \equiv \forall x \neg P(x)$$

$$\neg \forall x P(x) \equiv \exists x \neg P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

92

## Conjunction & Disjunction

Breaking Apart and Combining

## Conjunction & Disjunction

- Both the Exists and For-All quantifiers can be broken apart (and combined)
- This can occur if the expression contains an AND or an OR

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

94

## Exists Disjunction

- If the Exists quantifier is used on a disjunction, it can be broken into two Exists
- This only works with  $\forall$

$$\exists x (P(x) \vee Q(x)) \equiv \exists x P(x) \vee \exists x Q(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

95

## For-All Conjunction

- If the For-All quantifier is used on a conjunction, it can be broken into two For-All
- This only works with  $\wedge$

$$\forall x (P(x) \wedge Q(x)) \equiv \forall x P(x) \wedge \forall x Q(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

96

## Bound & Free Variables

Some variables are not variable

## Bound & Free Variables

- Not all variables used in a quantified expression is treated the same
- Each variable in an expression is either considered "bound" or "free"

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

98

## Bound & Free Variables

- A variable is *free* if a value must be supplied to it *before* expression can be evaluated
- A variable is *bound* if it not free (usually a dummy variable) and contains values that are not needed to be evaluated

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

99

## Example 1

- Which variables need we supply a value before the expression can be evaluated?
- Both x and c
- Without knowing both we cannot evaluate the expression (both are free)

$(x^2 < 4 * c)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

100

## Example 2

- Which variables need to be supplied before the expression can be evaluated?
- x: no, it is a dummy variable
- c: yes, once we give a value for c, we can evaluate the expression

$\forall x (x^2 < 4 * c)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

101

## Multiple Quantifiers

Many E's and A's doing headstands

## Multiple Quantifiers

- A quantified statement may have more than one quantifier
- In fact, most of the time, statements will contain several

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

103

## Example

- $x > y$  is an expression with two variables
- The expression is true if an  $x$  is supplied which is greater than  $y$

$\forall x \exists y P(x, y)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

104

## Example

- $\exists y (x > y)$  is an expression with one free variable
- Evaluates to true if  $x$  is supplied and there is a  $y$  greater than the supplied  $x$

$\forall x \exists y P(x, y)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

105

## Example

- $\forall x \exists y (x > y)$  contains no free variables
- Evaluates to true if  $\exists y (x > y)$  is true for every  $x$  in the universe.

$\forall x \exists y P(x, y)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

106

## Example 2

- The following is an implication with two quantifiers as operands
- It states that whenever " $\forall x P(x)$ " is a true statement, then so is " $\forall x Q(x)$ ".

$\forall x P(x) \rightarrow \forall x Q(x)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

107

## Difficult Example

- Let's create a quantified statement for the following logical statement
- We will go slowly, since this is not easy*

Everyone who has a friend who has measles will have to be quarantined

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

108

## Difficult Example

- "Everyone" is a For-All relationship
- So, we can factor it out into the expression below
- *Now*, let's look at the sub expression...

$\forall x$  (if  $x$  has a friend with measles,  
then  $x$  must be quarantined)

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

109

## Difficult Example

- The sentence "*if  $x$  has a friend with measles,  $x$  must be quarantined*" is an implication!
- Let's look at the antecedent (hypothesis)

if  $x$  has a friend with measles,  
then  $x$  must be quarantined

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

110

## Difficult Example

- How do we say " *$x$  has a friend with measles*"?
- They just need a *single* friend
- So, this is an Exists quantifier

$\exists y$  ( $x$  is friends with  $y$ , and  $y$  has measles)

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

111

## Difficult Example

- Now that we have a basic form of the final version, let's make some predicates
- We will use single letter names for brevity

$F(x, y)$  means " $x$  and  $y$  are friends"  
 $M(x)$  means " $x$  has measles"  
 $Q(x)$  means " $x$  must be quarantined"

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

112

## Difficult Example

- This says: "There exists a *person  $y$*  where  $y$  is friends with *person  $x$* , and  $y$  has measles"
- Note:  $x$  is *not* bound in this expression

$\exists y ( F(x, y) \wedge M(y) )$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

113

## Difficult Example

- So, what happens if a friend has measles?
- Then, they must be quarantined
- Note: implication is *outside* the exists

$\exists y ( F(x, y) \wedge M(y) ) \rightarrow Q(x)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

114

## Difficult Example

- Now we can put it all together...
- The following is the quantified expression for our original statement

$$\forall x ( \exists y ( F(x, y) \wedge M(y) ) \rightarrow Q(x) )$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

115

## Bounded Quantifiers

Hidden Implication  
(for those who hate to type)

## Bound Quantifiers

- Some quantifiers can be more than meets the eye
- For brevity, many predicate and propositional expresses are merged with the  $\forall$  and  $\exists$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

117

## Shorthand Notation

- The following type of expression is quite common
- So much so that a shortcut notation is often employed

$$\forall x ( R(x) \rightarrow P(x) )$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

118

## Shorthand Notation

- The membership sub-expression is moved to the quantifier's subscript
- This is equivalent to the last

$$\forall_{R(x)} P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

119

## Likewise...

- The sub-expression before the implication can be anything
- In this example,  $x > 5$  is moved to the subscript

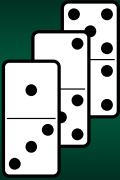

$$\forall x ( x > 5 \rightarrow P(x) )$$

$$= \forall_{x > 5} P(x)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

120

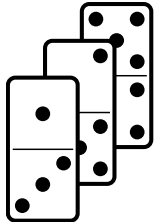

## Induction

Proof by Pattern

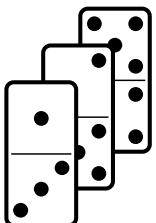

## Induction

- Many proofs, in fact a great number of them, are based on "all positive integers"
- Induction* is a technique of proving a theorem that is based on this criteria

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 122

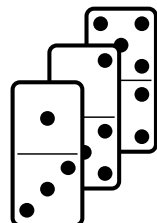

## Induction

- The proof by induction is based on the *Well-Ordering Property*
- It states that: given a set of non-negative numbers there is a *least* element

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 123

## Induction

- Induction basically helps prove  $\forall x P(x)$  where the universe is positive numbers
- Or any range starting at *one* point and going off to infinity (positive or negative)

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 124

## How it Works

- It works in 2 steps
  - proving  $P(1)$  and then
  - proving that  $P(n) \rightarrow P(n + 1)$
- As a result...
  - since  $P(n) \rightarrow P(n + 1)$
  - then  $P(n + 1) \rightarrow P(n + 2)$  and so on...

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 125

## Metaphor: Line

- There is a line of people
- First person tells a secret to the second person
- The second person then tells it to the third
- ... and so on until everyone knows the secret

3/15/2018 Sacramento State - Cook - CSc 28 - Spring 2018 126

## Metaphor: Dominoes

- You have a long row of Dominoes
- The first domino falls over and hits the second domino
- The second hits the third
- ... and so on until they are all knocked over

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

127

## Foundation of Induction

- The following summarizes the proof technique
- It is important to understand the approach since it is so commonly used

$$P(1) \wedge \forall n (P(n) \rightarrow P(n+1)) \rightarrow \forall n P(n)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

128

## Steps to Proof

- Step 1: *Basis*
  - show the proposition  $P(1)$  is true
  - very easy to do – just plug in the values
- Step 2: *Induction*
  - assume  $P(n)$  is true (which is your theorem)
  - show that  $P(n+1)$  must be true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

129

## Example: Sum of Odds

Using induction...

Show that the sum of  $n$  odd numbers equals  $n^2$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

130

## Example: Sum of Odds

- So, the sum of odd numbers is a square?
- Is that true?
  - $1 + 3 = 4$
  - $1 + 3 + 5 = 9$
  - $1 + 3 + 5 + 7 = 16$
- Okay, that's just odd! (*pun intended*)

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

131

## Basis: Sum of Odds

- The sum of odds, for just 1 number is simply 1
- Of course, this is also 1 squared

$$P(1) = 1 = 1^2$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

132

## Induction: Sum of Odds

$P(n)$  is written as:

$$1 + 3 + 5 + \dots + (2n - 1) = n^2$$

We assume  $P(n)$  is true.

Now we prove  $P(n) \rightarrow P(n + 1)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

133

## Induction: Sum of Odds

$P(n + 1)$  is written as:

$$1 + 3 + \dots + (2n-1) + (2n+1) = (n+1)^2$$

Let's look at the left hand side of the equation

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

134

## Induction: Sum of Odds

$$1 + 3 + \dots + (2n - 1) + (2n + 1)$$

$$= 1 + 3 + \dots + (2n - 1) + (2n + 1)$$

$$= n^2 + (2n + 1)$$

$$= (n + 1)^2$$

$P(n)$  assumed true, so the equality is true. You can replace!

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

135

## Induction: Sum of Odds

So, we have shown that when  $P(n)$  is true, then  $P(n + 1)$  is true.

$$P(n) \rightarrow P(n + 1)$$

Since  $P(1)$  is true, we have proved  $\forall n P(n)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

136

## Example: Divisible by 3

Using induction...

Show that  $n^3 - n$  is divisible by 3 whenever  $n$  is a positive integer

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

137

## Basis: Divisible by 3

- For our basis, we plug 1 into our expression and get the result
- The result, 0, is divisible by 3.

$$P(1) = 1^3 - 1 = 1 - 1 = 0$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

138

## Induction: Divisible by 3

$P(n)$  is written as:

$$n^3 - n$$

$P(n + 1)$  is written as:

$$(n + 1)^3 - (n + 1)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

139

## Induction: Divisible by 3

$$(n + 1)^3 - (n + 1)$$

$$= n^3 + 3n^2 + 3n + 1 - (n + 1)$$

$$= n^3 + 3n^2 + 3n - n$$

$$= n^3 - n + 3n^2 + 3n \quad \text{Rearranged}$$

$$= (n^3 - n) + 3(n^2 + n)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

140

## Induction: Divisible by 3

So, for  $(n^3 - n) + 3(n^2 + n)$

Since we assumed  $P(n)$  is true, then  $(n^3 - n)$  is divisible by 3.

... and  $3(n^2 + n)$  is divisible by 3 since 3 is a factor

Hence,  $P(n) \rightarrow P(n + 1)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

141

## Example: Sum of $2^n$

Using induction...

Show that  $2^0 + 2^1 + \dots + 2^n = 2^{n+1} - 1$  whenever  $n$  is a positive integer

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

142

## Basis: Sum of $2^n$

- For our basis, we plug 1 into our expression and get the result
- The result is 1 – which is true

$$P(0) = 2^0 = 1 = 2^1 - 1$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

143

## Induction: Sum of $2^n$

$P(n)$  is written as:

$$2^0 + 2^1 + 2^2 + \dots + 2^n = 2^{n+1} - 1$$

$P(n + 1)$  is written as:

$$2^0 + 2^1 + \dots + 2^n + 2^{n+1} = 2^{n+2} - 1$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

144

## Induction: Sum of $2^n$

$$2^0 + 2^1 + \dots + 2^n + 2^{n+1}$$

$$= (2^0 + 2^1 + \dots + 2^n) + 2^{n+1}$$

$$= (2^{n+1} - 1) + 2^{n+1}$$

$$= 2^{n+1} + 2^{n+1} - 1$$

$$= 2^n (2^1 + 2^1) - 1$$

$$= 2^n (2^2) - 1$$

$$= 2^{n+2} - 1$$

$P(n)$  assumed true, so the equality is true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

145

## Induction: Sum of $2^n$

Since we assumed  $P(n)$  is true...

$2^0 + 2^1 + \dots + 2^n + 2^{n+1}$  is equal to  $2^{n+2} - 1$

Hence,  $P(n) \rightarrow P(n+1)$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

146

## Example: Polygons

The sum of the interior angles of a convex polygon with  $n \geq 3$  corners is  $(n-2) * 180$  degrees.

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

147

## Example: Polygons

- Induction is not just useful for mathematical series
- It can also be used to prove concepts like geometry
- For this one, let's draw on the board rather than using slides...

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

148

## Example Polygons

- Since we can cut each polygon into triangles, we can show the number of points is related to the number of triangles
- In particular, the number of triangles is the number of points - 2

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

149

## Example: Sum of Integers

Using induction...

Show that the sum of  $n$  integers equals  $n(n+1)/2$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

150

## Induction: Sum of Integers

$P(n)$  is written as:

$$1 + 2 + \dots + n = n(n+1) / 2$$

$P(n+1)$  is written as:

$$1 + 2 + \dots + n + (n+1) = (n+1)(n+2) / 2$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

151

## Induction: Sum of Integers

$$1 + 2 + 3 + \dots + n + (n+1)$$

$$= n(n+1) / 2 + (n+1)$$

$$= (n^2 + n) / 2 + 2(n+1) / 2$$

$$= (n^2 + 3n + 2) / 2$$

$$= (n+1)(n+2) / 2$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

152

## Strong Induction

Another approach

## Strong Induction

- Weak induction assumes that  $P(n)$  is true, and then uses that to show  $P(n+1)$  is true
- Strong induction assumes  $P(1), P(2), \dots, P(n)$  are all true and then uses that to show that  $P(n+1)$  is true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

154

## Using the Domino Metaphor...

If all the dominoes (1 to  $n$ ) fell over, will it also have knocked over  $n+1$ ?

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

155

## Strong Induction

- So, strong induction uses more "dominoes" than weak induction – *which just uses one*
- Both proof techniques are equally valid

$$(P(1) \wedge P(2) \wedge \dots \wedge P(k)) \rightarrow P(k+1)$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

156

## Steps to Proof

- Step 1: *Basis*
  - show the proposition  $P(1)$  is true
  - very easy to do – just plug in the values
- Step 2: *Induction*
  - assume that  $P(1), P(2), \dots, P(n)$  are all true
  - show that  $P(n + 1)$  is true

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

157

## Example: Product of Primes

Using strong induction...

Show that any number  $n \geq 2$  can be written as the product of primes

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

158

## Basis: Product of Primes

- For 2, we can show that 2 is a product of two primes
- Namely, 1 and itself

$$P(2) = 1 * 2 = 2$$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

159

## Induction: Product of Primes

- There are two cases for  $n + 1$ :
- $P(n + 1)$  is prime
- $P(n + 1)$  is composite
  - it can be written as the product of two composites,  $a$  and  $b$
  - where  $2 \leq a \leq b < n + 1$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

160

## Induction: Product of Primes

**$n + 1$  prime:**

it is a product itself and 1

**$n + 1$  is composite:**

both  $P(a)$  and  $P(b)$  are assumed to be true

so, there exists primes where  
 $a * b = n + 1$

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

161

## Result

- We showed that any number can be either prime or composite of two numbers
- ... and that number holds the same
- As a result, we can keep moving backwards to show that everything must be whittled down to primes

3/15/2018

Sacramento State - Cook - CSc 28 - Spring 2018

162
