

## Flowchart

Start by entering `system.out.print` for preorder and postorder options to the java code that was given.

Enter a case 4 and case 5 for each preorder and postorder. Very similar to the inorder case. Checks if tree is empty, if it isn't it outputs a message and the tree in the chosen order.

Enter the methods for the preorder and postorder and follow the inorder method guideline. Rearrange the left, right, and print statements to get the ordering correct.
